Digital Resilience: Critical infrastructure for the AI Era

Cisco Showcase in World of Solutions at Cisco Live Las Vegas 2026

February 2026

Digital Resilience: World of Solutions Cisco Live Las Vegas

- **Objective:** Create an engaging and immersive experience that draws attendees into real-world scenarios that brings Cisco Data Fabric (powered by Splunk Platform), security, observability, and assurance to life and lets people get hands on to explore, investigate, and resolve issues, supported with agentic AI throughout.
- **Description:** Cinematic LED wall continuously renders simulated traffic across a representative organization, including data center, multi-cloud, branch, remote users, and applications and dynamically reflects security threats and performance degradation in real time through animated paths and visual state changes to draw attendees to engage in demos and hands–on experience.
  - Positions Cisco Data Fabric and digital resilience as the foundational element for critical infrastructure in the AI era (One Cisco story and pillars).
  - Connects Splunk and Cisco value propositions to show integration and differentiation with complete visibility, security, and agentic operations across the entire environment from data center to cloud to edge (and including both Cisco and non-Cisco devices and data)., with focus on network security and observability.

The Pulse Wall: Predict. Prevent. Protect.

The Pulse Wall: Visualizing Resilience

A 60-foot immersive LED display visualizing a live digital enterprise in motion.

The wall continuously renders simulated network traffic across data center, multi-cloud, branch, remote users, and applications. It dynamically reflects security threats and performance degradation in real time through animated paths and visual state changes. We can show the entire infrastructure from data center to edge, including Cisco and non-Cisco devices and data sources, and applications.

The wall is cinematic, not a dashboard.
It tells a story and invites the viewer to participate in the right demos and conversations. This dashboard can be adapted to all aspects of the World of Solutions showcase and can be tied to any theme (e.g. World Cup).

Visitors engage through guided scenarios in three modes:

Security Mode

- Investigate a realistic incident with all tools, including Splunk Enterprise Security, Cisco, and AI solutions.
- The attack path illuminates across the wall, showing lateral movement and potential data exfiltration.
- Selected Cisco controls visibly contain and neutralize the threat.
- Powering the Agentic SOC (and what that means).

Observability Mode

- Troubleshoot a degraded application using Splunk Observability, Cisco, and AI solutions.
- Transaction flows highlight across infrastructure and cloud dependencies.
- Root cause identification restores system stability on the wall.
- AI for observability and observability for AI and agentic ops.

Collaborative Mode

- Platform, Security, and Observability users work together on a shared use case.
- Each person investigates from their domain lens.
- Combined actions reveal the full enterprise impact and coordinated resolution.
- Real-time generative dashboards and collaboration with AI (e.g. AI Canvas, AI assistants, MCP, etc.)

Core objective:

- Highlight how Splunk platform is the building block for collecting information across your organization and tying it all together.
- Demonstrate AI and agentic operations everywhere with the unified Cisco Data Fabric (O11y, security, and data management)
- Turn Cisco and Splunk integration from a diagram into a tangible, shared operational experience.
- Demonstrates Cisco and Splunk integration at enterprise scale
- Reinforces unified operations across security and observability
- Drives targeted booth referrals for deeper solution engagement
- Illustrates Splunk as the glue that brings Cisco tools together in a cohesive whole

The Pulse Wall: Architecture and Business Impact

Visualization Layer
- 60-foot LED wall powered by animation engine and media server.
- All state changes are event-triggered and deterministic.
- Show how AI accelerates every step of the process.

Application Layer
- Hardened Splunk Enterprise Security and Splunk Observability demo environments with curated datasets.

Orchestration Layer
- Lightweight control and synchronization engine mapping user actions to predefined visual outcomes.

Business Outcomes
- Demonstrates unified Cisco and Splunk operations at enterprise scale
- Drives high-dwell engagement in the World of Solutions
- Captures structured intent data for follow-up
- Increases cross-portfolio interest through collaborative mode
- Architecture allows for smaller versions to use as a reusable storytelling asset for future events and executive briefings

The Pulse Wall: Miscellany

Cinematic experience and story, not a dashboard

- Kiosks show real Splunk (and Cisco) products and UI
- Wall is “living” with anomalies constantly appearing to invite curiosity
  - Follow path from network issue to solution with Splunk + Cisco
    - Data > detection > troubleshooting > resolution
    - Path colors correspond to kiosk colors, guiding visitors to most applicable capabilities
    - All powered by AI everywhere
- Two primary paths
  - Stop the cyber attack
  - Troubleshoot network performance issue
- Showcase multiple enterprise segments (core data center, IoT, SaaS, edge, branch offices, etc.)
  - Industry overlays on wall (retail, financial, telco, etc.)
- Continuous traffic flowing with three states always visible:
  - Healthy/normal, attack incoming, performance degradation brewing
- Include a tracked “score” component:
  - MTTR, blast radius containment, controls used, etc.
- Highlight list at the end guiding engagement with certain demo stations / parts of the show floor.
- Works with all of the World of Solutions sections
  - Digital Resilience, platform advantage, AI-ready data centers, future-proofed workplaces.
